Re: Senior AI Engineer — Aptus.AI

Dear Hiring Team,

I'm writing about the Senior AI Engineer role at Aptus.AI. You're looking for engineers who have built real multi-agent systems that reason, plan, and act autonomously in production, and that describes most of what I've done at PSP Investments over the past two years.

The Virtual Analyst Platform I built and own at PSP, a ~\$300B Canadian pension fund, runs on the same architectural pattern you describe: a LangGraph-based multi-agent graph that routes queries to specialized sub-agents (document retrieval, structured data analysis, synthesis), manages state across multi-turn workflows, and decides at runtime whether a query needs a fast single-step response or a deeper iterative research path. The system serves 300 users with 100 active recurring analysts and was selected for a live demo at the Databricks Data & AI Summit. The legal and compliance use cases Aptus.AI works on share the same core requirements as financial research automation: grounded outputs, traceable reasoning, and failure modes that matter.

What I'd bring specifically: production experience designing multi-agent orchestration systems with LangGraph, tool use and agent memory patterns, retrieval over structured and unstructured data, and the discipline to own a system end-to-end from architecture through production iteration. I've worked directly with non-technical users (portfolio managers, compliance teams) to understand requirements and ship AI that they actually rely on. I also built digithings.ai, an open-source modular multi-agent toolkit, as a side project that reflects how I think about agentic architecture more generally.

I'm an EU citizen relocating to Italy on June 1 with full right to work in the EU. My primary language is Python; TypeScript is a gap I'm working on closing. I'd want to confirm the remote vs. hybrid expectation before proceeding, as I'll be based in Italy but not necessarily near Pisa.
