Re: Senior Software Engineer, Agentic AI — Guidewire

Dear Hiring Team,

Guidewire's investment in production agentic AI for insurance data infrastructure is exactly the kind of problem space I have spent the last few years working in. At PSP Investments, one of Canada's largest pension funds (~\$300B AUM), I designed and built the Virtual Analyst Platform: a multi-agent AI system running on LangGraph, LiteLLM, and Azure AI Search, used daily by over 100 active investment analysts. The architecture includes end-to-end RAG pipelines, hybrid retrieval, embedding management, re-ranking, and prompt evaluation. I own everything from the FastAPI backend to Databricks-based LLM observability.

The technical fit with Guidewire's agentic AI stack is direct. I have production LangGraph experience: agentic loops with concurrency control, timeout handling, tool orchestration across multiple agents, and graceful degradation strategies for real-time analyst workloads. The RAG work I built at PSP involves chunking strategies tuned to dense financial documents, hybrid semantic and keyword search, and retrieval-time re-ranking, all patterns that apply cleanly to insurance document processing. I also built the AlphaScience SDK, a unified abstraction over OpenAI, Gemini, and Claude APIs with routing and observability, and the platform was selected for a live demo at the Databricks Data and AI Summit.

Python is my primary language and AsyncIO is part of my daily stack. I have used all three of the major LLM providers Guidewire targets, and I have shipped this work to production users in a high-stakes regulated domain, which prepares well for insurance-grade reliability requirements.

One honest note: EU remote eligibility for this role is not confirmed in the posting, and I would want to verify that before advancing. I am an EU citizen with no sponsorship requirements, relocating to Italy on June 1, 2026. TypeScript is familiar to me but Python is primary. Reach me at chris.stefan@proton.me or +1 514.710.9601.
