Re: Senior AI Engineer — Horizons

Dear Hiring Team,

I'm writing about the Senior AI Engineer role at Horizons. You're looking for someone to lead the design and deployment of LLM and RAG-based solutions across the organization, and I've been doing exactly that at PSP Investments for the past two years.

At PSP, a ~\$300B Canadian pension fund, I've built and operated the Virtual Analyst Platform end-to-end: RAG pipelines over internal documents and market data, multi-step agent orchestration with LangGraph, and the AlphaScience SDK that abstracts across OpenAI, Gemini, Claude, Databricks, and Azure AI Search into a unified interface. The platform serves 300 users with 100 active recurring analysts and was selected for a live demo at the Databricks Data & AI Summit. I've owned the architecture, deployment, and ongoing iteration of a production AI system used daily in a regulated financial environment.

What I'd bring to Horizons specifically: experience deploying production LLM and RAG systems that work reliably for non-technical users, the ability to work directly with business stakeholders to identify high-leverage AI use cases (a core part of my current role with portfolio managers and compliance teams), and a track record of building AI infrastructure that scales and can be maintained without constant intervention. I've implemented MLOps patterns, eval pipelines, and observability tooling in a context where reliability matters. Applying those skills to an international employment platform with a different user base and problem domain is a clear next step.

A brief note on fit: my primary language is Python; I don't use PyTorch or TensorFlow regularly (my work is more orchestration and deployment than model training). I'm an EU citizen relocating to Italy on June 1, with full right to work in the EU, fluent in English, French, and Romanian.
