Re: Lead Applied AI Engineer

Dear Hiring Team,

I'm writing about the Lead Applied AI Engineer role. At PSP Investments, a ~\$300B Canadian pension fund, I've spent the past two years building and operating a large-scale agentic AI platform end-to-end, and the technical scope of this role maps closely to that work.

The Virtual Analyst Platform I built serves 300 users with 100 active recurring analysts. It runs multi-agent LangGraph orchestration, semantic and hybrid RAG pipelines over structured and unstructured data using Azure AI Search, vector database integration, and a unified SDK (AlphaScience SDK) that abstracts across OpenAI, Gemini, Claude, and Databricks. I've built and maintained LLM evaluation pipelines and observability tooling in production, and I've implemented MCP-style protocol patterns for agent tool integration. The system was selected for a live demo at the Databricks Data & AI Summit.

What I'd bring to this role: hands-on experience with the full GenAI stack from retrieval and embedding through orchestration and observability, the ability to own a platform end-to-end without needing a large team, and practical experience with agentic workflows across enterprise business functions. I've operated in a high-stakes regulated environment where reliability and eval coverage are non-negotiable, which transfers directly to driving Generative AI initiatives across Finance, HR, and operational domains.

My cloud exposure is primarily Azure and Databricks rather than AWS ECS/EKS, though I'm comfortable with containers and CI/CD pipelines. TypeScript is a gap; Python is my primary language. I'm an EU citizen relocating to Italy on June 1, with full right to work in the EU.
