Re: Lead Agentic AI Engineer — OLX

Dear Hiring Team,

I'm writing about the Lead Agentic AI Engineer role at OLX. At PSP Investments, I've spent the last two years building exactly this kind of system: an enterprise agentic AI platform that automates research workflows for a team of investment analysts at a ~\$300B AUM pension fund.

The Virtual Analyst Platform I built and own end-to-end serves 300 users with 100 active recurring analysts. It runs LangGraph-based multi-agent orchestration, RAG pipelines over internal documents and external data, and connects to OpenAI, Gemini, Claude, Databricks, and Azure AI Search through a unified SDK I designed (AlphaScience SDK) that handles prompt routing, model switching, retrieval, and observability. The system was selected for a live demo at the Databricks Data & AI Summit. OLX's stack (Claude, OpenAI, LangGraph, n8n) maps almost exactly to what I work with today.

What I'd bring to this role specifically: production experience designing agentic systems with LangGraph and multi-step tool orchestration, SDK and platform design that makes AI capabilities composable and reusable across teams, hands-on integration of MCP-style orchestration patterns and LLM evaluation pipelines, and comfort owning complex AI infrastructure end-to-end without needing a large team around me. I've built for finance, a domain that demands the same reliability and observability standards OLX would need for Legal, HR, and Finance automation.

A candid note: my primary language is Python; JavaScript is secondary and Go is limited to reading. But all core work here is Python and I'm confident in the overlap. I'm an EU citizen relocating to Italy on June 1 with full right to work across the EU, fluent in English, French, and Romanian.
