Re: Applied AI Engineer — Percepta

Dear Hiring Team,

I'm writing about the Applied AI Engineer role at Percepta. You're looking for engineers who can build and ship production AI systems that create real impact for critical institutions, and that's exactly what I do at PSP Investments, a ~\$300B Canadian pension fund.

Over the past two years I've designed, built, and operated the Virtual Analyst Platform from the ground up: RAG pipelines over internal documents and market data, multi-step agents built on LangGraph, human-in-the-loop review flows, and the AlphaScience SDK that abstracts OpenAI, Gemini, Claude, Databricks, and Azure AI Search into a unified interface. The platform serves 300 users with 100 active recurring analysts and has reduced the research cycle by roughly 10x. It was selected for a live demo at the Databricks Data & AI Summit. I've owned the entire stack alone for most of the project's life, from requirements through architecture, deployment, and iteration.

What I'd bring to Percepta specifically: the ability to work directly with non-technical stakeholders to identify high-leverage AI use cases (I work with portfolio managers and compliance teams, not just engineers), full-stack ownership of LLM-powered systems in production, and the discipline to ship fast without cutting corners on reliability. I've built evals, monitoring, and guardrails for systems that analysts depend on every day. Percepta's pattern of embedding deeply with enterprise clients and shipping systems that actually change workflows is the kind of work I'm looking for next.

My primary language is Python; I work with Gradio on the front end rather than TypeScript/React. I'm confident I can pick up TypeScript in the workflows where it matters. I'm an EU citizen relocating to Italy on June 1, with full right to work across the EU, fluent in English, French, and Romanian.
