Re: Agentic Artificial Intelligence Engineer — Trimble

Dear Hiring Team,

I build production agentic AI systems for a living, and the work Trimble is doing on LLM-powered autonomous agents for logistics is exactly the kind of applied problem I want to be working on next. At PSP Investments, a \$300B CAD pension fund, I designed and built the Virtual Analyst Platform from scratch: an agentic AI system used daily by over 100 active analysts, built on LangGraph, LiteLLM, Azure AI Search, and Databricks, with a full RAG stack including hybrid retrieval, embedding pipelines, re-ranking, and custom chunking strategies tailored to financial documents.

The platform includes a multi-agent orchestration layer built with LangGraph that routes queries, manages memory, and coordinates tool-calling across specialized agents. I also built and maintain the AlphaScience SDK, which abstracts OpenAI, Gemini, and Claude APIs behind a unified interface with observability and routing logic baked in. The whole system was selected for a live demo at the Databricks Data and AI Summit. I own the full stack: FastAPI backend, Gradio frontend, Docker CI/CD, and Databricks for LLM observability and analytics.

For Trimble, a few things map directly. The embedding pipelines and chunking work I have done at PSP scale cleanly to freight document processing. The agent loop design, including concurrency handling, tool orchestration, and graceful degradation, is production-tested at daily analyst volume. Databricks for LLM observability is already part of my stack. And I have shipped agentic GenAI to real users in a regulated, high-stakes domain, which is the kind of production discipline logistics demands.

I am an EU citizen with no sponsorship requirements, relocating to Italy on June 1, 2026, and looking for a remote-first role. My Python is primary and my agentic AI experience is the core of my current role, not a side project. Happy to go deep on any part of the stack: chris.stefan@proton.me or +1 514.710.9601.
